Subject: Quarterly Report No. 19 - Third Quarter 2006 Full-Scale SVE System
Boeing Realty Corporation, Former C-6 Facility, Building 1/36 Area
Los Angeles, California

Dear Ms. Townsend:

This quarterly report summarizes the monitoring conducted during the operation of the full-scale soil vapor extraction (SVE) system for the third quarter 2006 (July 1 through September 30, 2006) at the former Boeing Realty Corporation (BRC) C-6 Facility, Building 1/36 area (Site). The Site is located at the northwest corner of Normandie Avenue and Knox Street in Los Angeles, California (Figure 1).

This report presents the Site background followed by a discussion of SVE operations and has been prepared in response to Regional Water Quality Control Board, Los Angeles Region (LARWQCB) reporting requirements.

Background

Results of previous investigation at the Site indicated the presence of volatile organic compounds (VOCs) at depth, requiring remediation to prevent possible impact to groundwater. SVE was recommended for the remediation of deep impacted soil (soil deeper than 12 feet below ground surface [bgs]).

Workplans for the SVE systems were submitted and approved by the LARWQCB in June 2001, and December 2001, respectively. The full scale system was installed in early 2002 and operated between May 2002 and September 2004. The SVE system was shut down to accommodate Site redevelopment in September 2004. The full scale SVE system was re-mobilized to the Site and restarted on March 2, 2006.

SVE System Description and History

SVE pilot testing at the Site was conducted between July and October 2001, when the pilot SVE system was shut down and the SVE wells were abandoned to accommodate Site grading. The pilot SVE system was re-installed and re-started in December 2001 and operated through March 2002.

Full scale SVE treatment of deep soils at the Site was started in May 2002. The full-scale SVE system then consisted of 43 well screens (17 dual and nine single screened SVE wells), a trailer-mounted 1,000 standard cubic feet per minute (scfm) blower system, three 8,000 pounds (lbs) granular activated carbon (GAC) vapor control vessels (primary, secondary, and stand-by), and associated piping.

In June 2002, unexpected exothermic carbon reactions with 2-Butanone (MEK) present in the influent stream required that the SVE system be shut down for repairs and modifications. The system was restarted on March 11, 2003. After system modifications, the system was optimized to remove mass and follow a seven-day carbon change-out frequency. Three, single-screened SVE wells were installed in June 2004. Full scale SVE treatment of deep soils at the Site continued through September 2004, when the system was shut down to facilitate Site redevelopment.

Prior to Site redevelopment, the SVE wells were cut, capped, surveyed, and buried at least 3 feet bgs to protect them from Site redevelopment activities. The SVE mechanical equipment, including carbon vessels, was removed and stored at an off-Site location. Between February 2005 and March 2006, during Site redevelopment, 46 well screens (17 dual and 12 single screened SVE wells) were uncovered and connected (including three new single screened wells), via subsurface piping, to the remediation compound located at the northeast corner of the Site (Figure 2) and the SVE mechanical equipment was re-mobilized to the Site. Full scale SVE system operations were restarted on March 2, 2006.

Operational Summary

Operations for the Third Quarter 2006 covered the period July 1, 2006 through September 30, 2006. Operational data for the full-scale SVE system is presented in Table 1.

Total hours of operation for this quarter were approximately 2208. The system was operated on a 24- hour-per-day basis with the exception of GAC change outs. Percent up time based on all hours in the third quarter is 82.1 percent. The system monthly percent operation time is

presented on Graph 1. The system was operated in compliance with South Coast Air Quality Management District (SCAQMD) permit requirements during this quarter.

A system maintenance activity log is provided in Table 2 and a summary of the system operational data is presented below:

Days of Operation	75.5 (1813 hours)
Available Days of Operation	92 (2208 hours)
Operational Time (%)	82.1%
Estimated Mass Removed during the 3rd Quarter 2006	358 lbs of VOCs
Cumulative Mass Removed (July 2001-October 2006)	32,836 lbs of VOCs

Operations Information, Third Quarter 2006

Key events that occurred during this quarter include:

- July 20, 2006 — Additional system influent sample was collected to determine the concentrations of compounds of concerns following system optimization activities conducted during the Second Quarter of 2006.
- August 3, 2006 — Split vapor samples of the Tedlar bag samples from the system were collected in Summa canisters.

Extraction well vapor concentrations measured at the end of the Third Quarter 2006 are plotted on Figure 3A and 3B. These measurements were taken at the field using a photo ionization detector (PID) calibrated to hexane. The well vapor concentration contours depicted on Figure 3 illustrate baseline start-up concentrations as well as remediation progress through September30, 2006. During this operation period, no system adjustments were made and no sample was collected from the individual wells.

The cumulative mass removed by the full-scale SVE system is shown in Graph 2. Total VOC concentrations reported in grab samples collected from the undiluted influent of the SVE system on a monthly basis are plotted on Graph 3. Exothermic reactions were not observed in the GAC beds during the Third Quarter of 2006.

Field Measurements

As per the SCAQMD permit requirements, flow rate and VOC concentration measurements were collected at the undiluted inlet, diluted inlet, between the GAC vessels, and at the exhaust stack. Flow rates were measured with a direct flow meter or by a hand-held Velocicalc meter™. Additional measurements collected during operation included vacuum readings at each extraction well, total inlet, and the GAC vessels and the blower exhaust temperature. The combined system influent VOC measurements since the system start up in March 2006 are presented in Table 1. Table 1 also includes the weekly field readings for system flow rates, temperature and vacuum. Field measurements of flow, VOC concentration, vacuum, and temperature were also collected at each SVE well during this quarter and presented in Table 3. Field measurements collected between March 2002 and September 2004 for individual wells are included in Appendix A.

During this period, individual SVE well flow rates ranged from approximately 13 to 36 scfm for a total flow rate from the well field of 178 to 980 scfm. The system operated with inlet vacuums ranging from approximately 27 to 48 inches of water.

Vapor Sampling And Analysis

During this quarter, monthly vapor samples were collected on July 13, August 3, and September 6, 2006. Additional confirmation inlet sample was also collected on July 20, 2006 to confirm styrene concentrations detected in the July 13 sample. The monthly samples were collected from the process air stream (one from the undiluted inlet to primary GAC vessel, one from the effluent of the primary GAC vessel, and one from the exhaust from the secondary GAC vessel) and delivered to a state-certified laboratory for analysis. These samples were collected for SCAQMD permit compliance as well as system performance evaluation. The August 3, 2006 vapor samples were collected using both Tedlar bags in a vacuum case and 6-liter stainless steel Summa canisters, which was under absolute vacuum (29 inches of mercury). The September 6, 2006 monthly samples were also collected using 6-liter Summa canisters. Subsequent vapor samples will be collected in Summa canisters. Laboratory analyses were conducted on vapor grab samples using EPA Method 21/TO-14A. The laboratory results of the vapor sampling conducted since the system start up in March 2006 are summarized for detected compounds in Table 4. Historical Laboratory results from June 2001 through September 2004 are included in Appendix B.

Based on the results of the laboratory analysis of vapor grab samples, maximum undiluted inlet VOC concentrations of detected compounds in parts per billion by volume (ppbv) for the period are as follows:

- 1,1-Dichloroethene (1,1-DCE) 1,300 ppbv
- Trichloroethene (TCE) 1,100 ppbv
- 1,1,1-Trichloroethane (1,1,1-TCA) 24,000 ppbv
- Tetrachloroethene (PCE) 35 ppbv
- 1,1-Dichloroethane (1,1-DCA) 120 ppbv
- trans-1,1-Dichloroethene (trans 1,2-DCE) 28ppbv
- cis-1,2-Dichloroethene (cis 1,2-DCE) 130 ppbv
- 2-Butanone (MEK) 9,400 ppbv
- Acetone 500 ppbv
- 4-Methyl-2-pentanone(MIBK) 830 ppbv
- Methylene chloride 8.6 ppbv
- Toluene 6,900 ppbv
- Total Xylenes 290 ppbv
- Chloroform 41 ppbv
- 1,2-Dichloroethane (1,2-DCA) 4.2 ppbv
- Styrene 7.5 ppbv
- Trichlorofluoromethane 11 ppbv

1,1,1-TCA was the VOC detected at the highest concentration during the Third Quarter of 2006. Elevated concentrations of MEK were also detected during the Third Quarter of 2006 since seven wells which are known to produce MEK were brought on-line in April 2006.

Styrene was detected in the effluent sample collected on July 13, 2006 at a concentration of 7.5 ppbv, which exceeded the SCAQMD requirement level of 5 ppbv. However, styrene was not detected in the inlet and the breakthrough samples collected at the same time. In addition, individual SVE well results collected in April 2006 also did not indicate any styrene detections. A notification was sent to SCAQMD on July 27, 2006 documenting the styrene concentration in the effluent and indicating that a Maximum Incremental Cancer Risk (MICR) analysis, which is required for trace toxic compounds, was not conducted because styrene does not have an assigned unit risk factor. The sample results from August and September

2006 showed no styrene detection in any samples and assured compliance with the SCAQMD site specific requirements.

Mass Removal Rates

Based on the laboratory results between July 7, 2006 and October 2, 2006, approximately 358 lbs of VOCs were estimated to have been removed from the Site. On July 20, 2006 the estimated total VOC removal rate was approximately 5.72 lbs/day. On September 6, 2006, the estimated total VOC removal rate decreased to 4.2 lbs/day. Monthly mass removal rates are illustrated in Graph 2.

Figures 3A and 3B depict well field VOC concentrations and contours, based on data collected since the system was restarted in 2003. Well field MEK concentration contours, from between December 2002 and April 2006 are depicted on Figures 4A and 4B.

Future Operational Plans

Based on VOC concentration measurements and mass removal rates observed this quarter, SVE operations will continue during the Fourth Quarter 2006. This will include:

- Weekly monitoring of system parameters and well field VOC concentrations.
- Well field optimization to maximize source area mass removal while maintaining maximum system flow, extracting from as many wells as possible, and balance GAC usage rates.
- Weekly sampling to assure compliance with SCAQMD permit conditions.
